

Does your Wireless System Operate in the 600 MHz Spectrum?

According to FCC rules, wireless microphones and personal monitors that are capable of operating in the auctioned 600 MHz spectrum (616-653 MHz and 663-698 MHz) will eventually be prohibited by law after a transition period.

If a local mobile broadband licensee begins using the 600 MHz Band during this transition period, the wireless user must change frequencies to avoid interfering with them.

Shure offers a variety of wireless systems that operate in VHF, UHF, 900 MHz, and 2.4GHz Bands. Since January 2015, Shure has been discontinuing systems that operate in the 600 MHz Band.

Our goal is to help people make the transition from impacted products to new systems that will provide dependable service and comply with updated FCC regulations. Customers using wireless systems that operate in the 600 MHz Band should plan to transition to another range of spectrum.

To see if your system has been impacted by this FCC auction and is eligible for a trade-in rebate, simply follow the steps below or click on the Shure Resource center for more information.
