

# STRINGING YOUR TAYLOR GUITAR

**T**o properly set the ball end of the string against the pin plate, pull up on the string with the left hand, as you push down on the bridge pin with your right hand. Failing to do this properly can result in an internal body rattle, from the ball end of the string not seating on the underside of

the top. Note that the saddle is not glued in the slot and may dislodge without the string pressure holding it firmly in place. If your bridge pins seem slightly loose when restringing, spin the channel in the pin itself away from the string when inserting it into the bridge.
